

Dhruv's 30 Days Workout Plan

30-day bodyweight strength, fat-loss, running and budget nutrition plan

Name	Dhruv Bamal
Age / Sex	20 / Male
Height / Weight	176 cm / 80 kg
Training	Home, bodyweight only
Current running	3 km daily; approximately 17-20 minutes
Main goals	Reduce overall body fat and love handles; build muscle and strength; improve stamina; develop a V-t
Food pattern	2 meals/day; vegetarian on Tuesday, Thursday and Saturday
Food budget	Approximately Rs. 100-150/day

Important: Love handles and chest fat cannot be selectively burned. The plan targets overall fat loss while building shoulders, chest, core and posterior-chain strength to improve proportions. With no pulling equipment, lat/back development is limited; a pull-up bar or resistance band would be a useful future addition.

1. Plan Overview

- **Training status:** Returning beginner. The first week emphasizes technique and tolerance before workload increases.
- **Nutrition starting point:** Approximately 2,000-2,200 kcal/day. Aim for roughly 100-120 g protein/day within the stated budget.
- **Daily rhythm:** Meal 1 around 12:00-12:30 AM; 3 km run around 2:00 AM; strength training after the run; Meal 2 around 4:30-5:00 AM.
- **Recovery:** Continue getting 8-9 hours of sleep. Seven available training days does not mean seven hard days; recovery sessions are deliberately included.

Warm-up and Training Rules

- Before every strength session, warm up for 5-7 minutes: marching or easy jogging in place, arm circles, hip circles, leg swings, ankle rotations, 10 bodyweight squats, 5-10 easy push-ups and dynamic mobility.
- Use controlled repetitions. For most exercises, lower for about 2-3 seconds, pause briefly, then drive upward with good form.
- Rest about 60-90 seconds between normal sets and up to 2 minutes after difficult sets.
- Stop most sets with roughly 1-3 good repetitions left. Do not repeatedly train to complete failure.
- Most 3 km runs should be easy or moderate. Only designated sessions should be hard.

2. Workout Templates

Workout A - Push, Chest and Shoulders

- Push-ups - 3-5 sets
- Pike push-ups - 3-4 sets
- Wide push-ups - 2-4 sets
- Diamond/close-grip push-ups - 2-3 sets
- Slow push-ups - 2 sets
- Plank - 2-3 sets

Workout B - Legs and Glutes

- Bodyweight squats - 4 sets
- Reverse lunges - 3-4 sets per leg
- Stationary split squats - 3 sets per leg; use Bulgarian split squats only with a genuinely stable household surface
- Single-leg glute bridges - 3 sets per leg
- Calf raises - 4 sets
- Wall sit - 2-3 sets

Workout C - Back/Posture and Core

- Prone Y-T-W raises - 3 rounds
- Reverse snow angels - 3 sets
- Superman pull-downs - 3-4 sets
- Prone cobra hold - 3 sets
- Dead bugs - 3 sets

- Reverse crunches - 3 sets
- Side planks - 3 sets per side
- Hollow-body hold - 2-3 sets

These movements are useful under the zero-equipment constraint, but they are not full substitutes for rows, pull-ups or chin-ups.

Workout D - Full-Body Conditioning

Perform squats, push-ups, alternating reverse lunges, mountain climbers, glute bridges and plank shoulder taps as a circuit. The exact rounds and repetitions progress through the month.

Recovery Session

Perform 20-30 minutes of easy mobility and stretching for the hips, calves, hamstrings, quadriceps, chest, shoulders and thoracic spine. Add an easy core circuit only if you feel fresh.

3. Days 1-7 - Foundation

Day	Run	Strength / Recovery
1	3 km easy	A: 3x8-12 push-ups; 3x6-10 pike; 2x10-15 wide; 2x6-10 close-grip; 2x30 sec plank.
2	3 km easy	B: 4x15 squats; 3x10/leg reverse lunges; 3x10/leg split squats; 3x12/leg glute bridge; 4x20 calf raises.
3	3 km moderate	C: 3x8 Y-T-W; 3x12 snow angels; 3x12 Superman pulls; 3x10 dead bugs/side; 3x12 reverse crunches.
4	3 km very easy	Recovery + 20-30 min mobility.
5	3 km easy	Repeat A; try to add 1 rep per set while preserving form.
6	3 km moderate	B; add 2-3 squat reps per set and 1 lunge rep per leg.
7	3 km easy	D: 4 rounds - 15 squats, 8-12 push-ups, 8 lunges/leg, 20 mountain climbers, 15 bridges, 10 shoulder taps/side.

Week 1 is deliberately conservative. Finish it with clean technique rather than chasing exhaustion.

4. Days 8-14 - Build Volume

Day	Run	Strength / Recovery
8	3 km easy	A: 4x10-15 push-ups; 4x8-12 pike; 3x12-15 wide; 3x8-12 close-grip; 3x40 sec plank.
9	3 km easy	B: 4x20 squats; 4x12/leg lunges; 3x12 split squats; 3x15/leg bridges; 4x25 calves.
10	3 km intervals	Within 3 km, alternate about 1 min fast / 1 min easy. Then C, adding 1 set to Superman pulls + 3x30 sec side plank/side.
11	3 km very easy	Recovery/mobility.
12	3 km easy	A; use a 3-sec lowering phase on the final set of each push-up variation.
13	3 km moderate	B + 3x45-60 sec wall sits.
14	3 km easy	D: 5 rounds of the Day 7 circuit.

Interval running should be fast but controlled, not repeated all-out sprinting.

5. Days 15-21 - Strength Emphasis

Day	Run	Strength / Recovery
15	3 km easy	A: 4x12-18 push-ups; 4x8-12 pike; 3x8-12 diamond; 3x6-10 slow push-ups.
16	3 km easy	B: 4x20 slow squats; 4x12/leg reverse lunges; 4x10-15/leg split squats; 4x15 single-leg bridges.
17	3 km moderate	C: 4 rounds Y-T-W; 4x15 snow angels; 4x15 Superman pulls; 3x15 reverse crunches; 3x40 sec side plank/side.
18	3 km very easy	Recovery.
19	3 km progression	Run easy -> moderate -> hard across the 3 km, then Workout A.
20	3 km easy	B + 4x25 calf raises + 3x60 sec wall sit.
21	3 km easy	D: 5 rounds - 20 squats, 12 push-ups, 10 lunges/leg, 30 mountain climbers, 20 bridges, 12 shoulder taps/side.

When high-rep movements become easy, use slower eccentrics, pauses or harder variations rather than endlessly adding repetitions.

6. Days 22-28 - Peak Week

Day	Run	Strength / Recovery
22	3 km easy	A: 5 push-up sets + 4 pike sets + 3 diamond sets + 3 slow push-up sets.
23	3 km easy	B: 5x20 squats; 4x15/leg lunges; 4x12-15 split squats; 4x15/leg single-leg bridges.
24	3 km intervals	C: 4 rounds + 3x30-45 sec hollow hold.
25	3 km very easy	Recovery/mobility only.
26	3 km moderate	A; attempt to beat Day 22 by reps OR quality, not both.
27	3 km easy	B + wall sits. If legs feel unusually heavy, make the run very easy.
28	3 km easy	D: 5-6 controlled rounds.

7. Days 29-30 - Benchmark

Day 29 - Strength benchmark: Run 3 km easy. After adequate recovery, test one maximum-quality set of push-ups. Rest 3-4 minutes. Then perform 3x10 pike push-ups, 3x15 split squats per leg, 3x15 Superman pull-downs, and test one maximum plank hold. Compare with Week 1.

Day 30 - Running benchmark: Warm up properly and run a 3 km time trial. This is the designated day to try to improve on the previous 17-20 minute range. Do not perform a hard strength workout afterward. Walk 5-10 minutes and complete easy mobility.

8. Budget Diet Plan

Use a practical 7-day rotation rather than buying 30 different menus. Repeat the pattern for Days 1-28. Tuesday, Thursday and Saturday are always vegetarian, regardless of where the numbered day falls on the calendar.

Suggested daily starting target: approximately 2,000-2,200 kcal and roughly 100-120 g protein. Treat this as a starting point rather than a medical prescription; adjust based on energy, recovery, hunger and weight/waist trend.

Day	Meal 1 - Pre-training	Meal 2 - Post-training
Mon	Oats + milk + banana + 3 eggs	Rice + about 200 g chicken + dal + vegetables + curd
Tue - Veg	Oats + milk + banana + roasted chana	Rice + 75-100 g dry soy chunks + dal + vegetables + curd
Wed	Rice/roti + 3 eggs + banana + curd	Rice + about 200 g chicken + dal + vegetables
Thu - Veg	Oats + milk + banana + peanuts	Rice + soy-chunk curry + dal + vegetables + curd
Fri	Oats + milk + 3 eggs + banana	Rice + chicken + dal + vegetables + curd
Sat - Veg	Rice/roti + dal + curd + banana	Rice + 75-100 g soy chunks + dal + mixed vegetables
Sun	Oats + milk + banana + 3 eggs	Rice + chicken + dal + vegetables + curd

Days 8-14, 15-21 and 22-28: repeat the Monday-Sunday rotation. **Days 29-30:** use the menu corresponding to the actual weekday; vegetarian rules always override the numbered plan.

Making Two Meals Work

- Non-vegetarian days: an economical protein base can include about 200 g chicken, 3-4 eggs, dal and milk/curd, alongside rice/oats/roti, vegetables and fruit.
- Vegetarian days: 75-100 g dry soy chunks are especially useful for low-cost protein. Combine with dal, milk/curd and grains.
- Peanuts are useful but calorie-dense; do not rely on them as the primary protein source.
- Meal 1 should be relatively easy to digest because the run follows 1-2 hours later. Avoid making it very oily or excessively large.
- Meal 2 can be the larger meal: rice/roti + major protein source + dal + vegetables + curd.
- Protein powder is not required for this plan.

9. Hydration, Recovery and Tracking

- Drink water throughout your waking day rather than trying to catch up immediately before the run. Persistently dark urine can be a simple sign that more fluid may be needed.
- Protect the existing 8-9 hours of sleep. A 2-4 AM training schedule can work if it is consistent and does not fragment or shorten sleep.
- Because you study while standing, alternate standing, sitting and brief walking rather than staying in one position for very long periods.
- Track waist circumference around the navel on Days 1, 8, 15, 22 and 30 under similar conditions.
- Record morning body weight several times per week and focus on the trend, not one reading.

10. Four Rules for the Month

1. Do not race every 3 km. Most runs should be comfortable enough that you could speak in short sentences. Save harder effort for designated sessions.

2. Progress exercises, not just reps. When 15-20 clean repetitions become easy, slow the lowering phase, pause, or use a harder variation.

3. Track the waist and performance. A smaller waist together with better push-ups, planks and running is more informative than scale weight alone.

4. Do not crash diet. The goal is a smaller waist while retaining or building muscle. Severe restriction can undermine strength, recovery and adherence.

Safety Note

Stop training and seek appropriate medical advice for chest pain, fainting, unusual shortness of breath, or persistent joint pain rather than normal muscular fatigue. If a movement causes sharp pain, stop that movement and substitute a pain-free alternative.

After the 30 days, the most useful equipment addition for the V-taper and balanced strength goals would be a safe way to perform pulling movements, such as a pull-up bar or resistance bands.
